Extending the life cycle, reducing waste, and enhancing the recycling of wind turbine materials are important strategies to promote and reduce the environmental impact of wind energy systems. These ...

The wind farm where the accident occurred was completed in 2005. Considering that renewable energy facilities typically have a design lifespan of around 20 years, the collapse occurred at a ...

A review of the root causes and mechanisms of damage and failure to wind turbine blades is presented in this paper. In particular, the mechanisms of leading edge erosion, adhesive joint degradation, ...

This article explores the evolution of blade disposal practices, current solutions, and innovations that promise a more sustainable future for wind power infrastructure.

The rapid expansion of wind farms has led to a growing challenge: the escalating accumulation of decommissioned wind turbine blades in landfills.

Most blades end their lives in landfill or are incinerated. It's a problem that's vexed the wind energy industry and provided fodder for those who seek to discredit wind power. But in...

While most of a wind turbine can be reused, its enormous fiberglass blades are difficult to dispose of when they reach the end of a 20-25 year life span. This has led to vast graveyards of...

Despite six truckloads of debris (so far) from the 70-ton Vineyard Wind turbine blade that fell apart on July 13 being carted away, pieces of fiberglass, foam, and plastic continue to be spotted ...

Wind turbine blades make up less than 8% of the total wind turbine's mass; however, recycling of blades has proven to be more challenging because of the materials and methods used to make them.

The wind turbine blades have turned away

Off the Yorkshire coast, 120 miles out into the North Sea at the Sofia wind farm, 50 turbines have been installed in recent weeks with a new type of fully recyclable blade.
